

Photo Carousel

Goal: Create a photo selection carousel

The carousel is based on the Photos.app sharing UI. To get to this screen, open Photos.app, select a photo, and press the share button in the lower left corner. Your carousel will allow the user to view the photos in the camera roll. The user will be able to select multiple photos by tapping on them. When the “Count” button is pressed, an alert will display the number of currently selected photos. Please see the mock-up below for reference.

Requirements

1. Don't use any third party code or Cocoapods.
2. All of the UI must be written in code. Do not use Interface Builder.
3. Pay attention to the animation of the selection bubble as you scroll in the Photos.app UI. Match the animation in your carousel as closely as possible.
